add.col.legend 3

add.col.legend	Add a legend indicating point colors of quarters.	
----------------	---	--

Description

Add a legend indicating point colors of quarters.

Usage

```
add.col.legend(qs, cols, pch = 1)
```

Arguments

qs Quarters to plot legend for.
cols Vector containing colors.
pch Point character.

Value

Nothing.

annual	Convert from quarterly (or other sub-annual) data to annual means or
	sums.

Description

Convert from quarterly (or other sub-annual) data to annual means or sums.

Usage

```
annual(intime, vec, type = "mean")
```

Arguments

intime A time vector corresponding to the values in vec.

vec The vector of values to convert to annual means

type If type='mean' then annual mean is calculated, if type='sum' then annual sum

is calculated.

Value

A list containing the annual means and a corresponding time vector.

4 calc.EBinf

25	row	1	÷	n	_
ar	row		-1	n	е

Draw a line with arrow heads.

Description

Draw a line with arrow heads.

Usage

```
arrow.line(x, y, length = 0.25, angle = 30, code = 2, col = par("fg"),
    lty = par("lty"), lwd = par("lwd"), ...)
```

Arguments

x	X coordinates.
У	Y coordinates.
length	See documentation for arrows.
angle	See documentation for arrows.
code	See documentation for arrows.
col	See documentation for arrows.
lty	See documentation for arrows.
lwd	See documentation for arrows.
	See documentation for arrows.

Details

Add to an existing plot a continuous line with arrow heads showing the direction between each data point

Value

Nothing, but an arrow line is added to the current plot.

calc.	FBi	nf

Calculate E(Binfinity) the fished equilibrium.

Description

Calculate E(Binfinity) the fished equilibrium.

Usage

```
calc.EBinf(K, n, Fl, Fmsy, sdb2)
```

calc.gamma 5

Arguments

K The carrying capacity.

n Pella-Tomlinson exponent.

F1 Average fishing mortality of the last year.

Fmsy Fishing mortality at MSY.

sdb2 Standard deviation squared (variance) of B process.

Details

If a seasonal pattern in F is imposed the annual average F is used for calculating the expectation.

Value

E(Binf).

calc.gamma

Calculate gamma from n

Description

Calculate gamma from n

Usage

calc.gamma(n)

calc.influence

Calculates influence statistics of observations.

Description

Calculates influence statistics of observations.

Usage

```
calc.influence(rep)
```

Arguments

rep

A valid result from fit.spict().

Details

TBA

6 calc.osa.resid

Value

A list equal to the input with the added key "infl" containing influence statistics.

Examples

```
data(pol)
rep <- fit.spict(pol$albacore)
rep <- calc.osa.resid(rep)
rep <- calc.influence(rep)</pre>
```

calc.osa.resid

Calculate one-step-ahead residuals.

Description

Calculate one-step-ahead residuals.

Usage

```
calc.osa.resid(rep, dbg = 0)
```

Arguments

rep A result report as generated by running fit.spict.

dbg Does nothing. Only preserved for backward compatibility with old osar func-

tion.

Details

In TMB one-step-ahead residuals are calculated by sequentially including one data point at a time while keeping the model parameters fixed at their ML estimates. The calculated residuals are tested for independence in lag 1 using the Ljung-Box test (see Box.test).

Value

An updated result report, which contains one-step-ahead residuals stored in \$osarC and \$osarI.

```
data(pol)
rep <- fit.spict(pol$albacore)
rep <- calc.osa.resid(rep)
plotspict.osar(rep)</pre>
```

check.inp 7

check.inp

Check list of input variables

Description

Check list of input variables

Usage

check.inp(inp)

Arguments

inp

List of input variables, see details for required variables.

Details

Fills in defalut values if missing. Required inputs:

- "inp\$obsC" Vector of catch observations.
- "inp\$obsI" List containing vectors of index observations.
- "inp\$ini\$logr" Initial value(s) for logr (log intrinsic growth rate). Can be specified as a scalar, or a vector of length 2 or 4. If length(logr)=2 different r values are estimated for first and second half of the year, if length(logr)=4 different r values are estimated for the four quarters of the year.
- "inp\$ini\$logK" Initial value for logK (log carrying capacity).
- "inp\$ini\$logq" Initial value for logq (log catchability of index).
- "inp\$ini\$logsdb" Initial value for logsdb (log standard deviation of log biomass).
- "inp\$ini\$logsdf" Initial value for logsdf (log standard deviation of log fishing mortality).

Optional inputs: - Data

- "inp\$timeC" Vector of catch times. Default: even time steps starting at 1.
- "inp\$timeI" List containing vectors of index times. Default: even time steps starting at 1.
- "inp\$dtc" Time interval for catches, e.g. for annual catches inp\$dtc=1, for quarterly catches inp\$dtc=0.25. Can be given as a scalar, which is then used for all catch observations. Can also be given as a vector specifying the catch interval of each catch observation. Default: min(diff(inp\$timeC)).
- "inp\$nseasons" Number of within-year seasons in data. If inp\$nseasons > 1 then a cyclic B spline is used to impose a seasonal pattern in F. The parameters of the spline are phi and are estimated. Valid values are 1, 2 or 4. Default: number of unique within-year time points present in data.

- Parameters

8 check.inp

• "inp\$ini\$logn" Pella-Tomlinson exponent. Default: log(2) corresponding to the Schaefer formulation.

- "inp\$ini\$phi" Vector for cyclic B spline representing within-year seasonal variation. Default: rep(1, inp\$nseasons).
- "inp\$ini\$logalpha" sdi = alpha*sdb. Default: log(1).
- "inp\$ini\$logbeta" sdc = beta*sdf. Default: log(1).
- "inp\$ini\$logF" Default: log(0.2*r).
- "inp\$ini\$logB" Default: log(0.5*K).
- Priors Priors on model parameters are assumed Gaussian and specified in a vector of length 3: c(log(mean), stdev in log, useflag). NOTE: if specifying a prior for logB, then a 4th element is required specifying the year the prior should be applied. log(mean): log of the mean of the prior distribution. stdev in log: standard deviation of the prior distribution in log domain. useflag: if 1 then the prior is used, if 0 it is not used. Default is 0. Example: inp\$priors\$logr <- c(log(0.8), 0.1, 1) Example: inp\$priors\$logB <- c(log(200), 0.2, 1, 1985) Settings
 - "inp\$dtpredc" Length of catch prediction interval in years. Default: max(inp\$dtc).
 - "inp\$timepredc" Predict catches in interval lengths given by \$dtpredc until this time. Default: Time of last observation.
 - "inp\$timepredi" Predict index until this time. Default: Time of last observation.
 - "inp\$do.sd.report" Flag indicating whether SD report (uncertainty of derived quantities) should be calculated. For small values of inp\$dteuler this may require a lot of memory. Default: TRUE.
 - "inp\$reportall" Flag indicating whether quantities derived from state vectors (e.g. B/Bmsy, F/Fmsy etc.) should be calculated by SD report. For small values of inp\$dteuler (< 1/32) reporting all may have to be set to FALSE for sdreport to run. Additionally, if only reference points of parameter estimates are of interest one can set to FALSE to gain a speed-up. Default: TRUE.
 - "inp\$robflagc" Flag indicating whether robust estimation should be used for catches (either 0 or 1). Default: 0.
 - "inp\$robflagi" Flag indicating whether robust estimation should be used for indices (either 0 or 1). Default: 0.
 - "inp\$ffac" Management scenario represented by a factor to multiply F with when calculating the F of the next time step. ffac=0.8 means a 20% reduction in F over the next year. The factor is only used when predicting beyond the data set. Default: 1 (0% reduction).
 - "inp\$dteuler" Length of Euler time step in years. Default: min(inp\$dtc).
 - "inp\$phases" Phases can be used to fix/free parameters and estimate in different stages or phases. To fix e.g. logr at inp\$ini\$logr set inp\$phases\$logr <- -1. To free logalpha and estimate in phase 1 set inp\$phases\$logalpha <- 1.
 - "inp\$osar.method" Method to use in TMB's oneStepPredict function. Valid methods include: "oneStepGaussianOffMode", "fullGaussian", "oneStepGeneric", "oneStepGaussian", "cdf". See TMB help for more information. Default: "none" (i.e. don't run this).

Value

An updated list of input variables checked for consistency and with defaults added.

extract.simstats 9

Examples

```
data(pol)
(inp <- check.inp(pol$albacore))</pre>
```

extract.simstats

 $\label{thm:extracts} \textit{Extracts relevant statistics from the estimation of a simulated data set.}$

Description

Extracts relevant statistics from the estimation of a simulated data set.

Usage

```
extract.simstats(rep, inp)
```

Arguments

rep A result report as generated by running fit.spict.

inp The input list used as input to the validation.spict function.

Details

TBA

Value

A list containing the relevant statistics.

```
data(pol)
sim <- sim.spict(pol$albacore)
rep <- fit.spict(sim)
extract.simstats(rep)</pre>
```

10 fit.spict

	. sp	

Fit a continuous-time surplus production model to data.

Description

Fit a continuous-time surplus production model to data.

Usage

```
fit.spict(inp, dbg = 0)
```

Arguments

inp List of input variables as output by check.inp.

dbg Debugging option. Will print out runtime information useful for debugging if

set to 1. Will print even more if set to 2.

Details

Fits the model using the TMB package and returns a result report containing estimates of model parameters, random effects (biomass and fishing mortality), reference points (Fmsy, Bmsy, MSY) including uncertainties given as standard deviations.

Fixed effects:

- "logm" Log of maximum sustainable yield.
- "logK" Log of carrying capacity.
- "logq" Log of catchability vector.
- "logsdf" Log of standard deviation of fishing mortality process noise.
- "logsdb" Log of standard deviation of biomass process noise.

Optional parameters (which are normally not estimated):

- "phi" Used when inp\$nseasons > 1 to specify the cyclic B spline representing seasonal variation.
- "logalpha" Proportionality factor for the observation noise of the indices and the biomass process noise: sdi = exp(logalpha)*sdb. (normally set to logalpha=0)
- "logbeta" Proportionality factor for the observation noise of the catches and the fishing mortality process noise: sdc = exp(logbeta)*sdf. (this is often difficult to estimate and can result in divergence of the optimisation. Normally set to logbeta=0)
- "logn" Parameter determining the shape of the production curve as in the generalised form of Pella & Tomlinson (1969). Default: log(2).

Random effects:

• "logB" Log of the biomass process given by the continuous-time stochastic Schaefer equation: $dB_t = r^*B_t^*(1-(B_t/K)^n)^*dt + sdb^*dW_t$, where dW_t is Brownian motion.

get.AIC

• "logF" Log of the fishing mortality process given by: F_t = D_s*G_t, where D_s is a cyclic B spline and dG_t = sigma_F * dV, with dV being Brownian motion.

Derived parameters:

- "logr" Log of intrinsic growth rate (r = 4m/K).
- "logBmsy" Log of the equilibrium biomass (Bmsy) when fished at Fmsy.
- "logFmsy" Log of the fishing mortality (Fmsy) leading to the maximum sustainable yield.
- "MSY" The yield when the biomass is at Bmsy and the fishing mortality is at Fmsy, i.e. the maximum sustainable yield.

The above parameter values can be extracted from the fit.spict() results using get.par().

Model assumptions

- "1"The intrinsic growth rate (r) represents a combination of natural mortality, growth, and recruitment.
- "2"The biomass B_t refers to the exploitable part of the stock. Estimates in absolute numbers (K, Bmsy, etc.) should be interpreted in light of this.
- "3"The stock is closed to migration.
- "4" Age and size-distribution are stable in time.
- "5"Constant catchability of the gear used to gather information for the biomass index.

Value

A result report containing estimates of model parameters, random effects (biomass and fishing mortality), reference points (Fmsy, Bmsy, MSY) including uncertainties given as standard deviations.

Examples

```
data(pol)
rep <- fit.spict(pol$albacore)
summary(rep)
plot(rep)</pre>
```

get.AIC

Calculate AIC from a rep list.

Description

Calculate AIC from a rep list.

Usage

```
get.AIC(rep)
```

get.msyvec

Arguments

rep

Value

AIC

get.EBinf

Calculate E(Binfinity) the fished equilibrium.

Description

Calculate E(Binfinity) the fished equilibrium.

Usage

```
get.EBinf(rep)
```

Arguments

rep

A result of fit.spict.

Details

If a seasonal pattern in F is imposed the annual average F is used for calculating the expectation.

Value

E(Binf).

 ${\tt get.msyvec}$

If multiple growth rates (r) are used (e.g. for a seasonal model), return specified reference point for all instances of r.

Description

If multiple growth rates (r) are used (e.g. for a seasonal model), return specified reference point for all instances of r.

Usage

```
get.msyvec(inp, msy)
```

get.par 13

Arguments

inp	An input list as validate	ed by check.inn().
±11P	in input list us validate	a of checking().

msy Matrix containing reference point values as given by get.par().

Value

A list containing reference point estimates with upper and lower CI bounds.

get.par	Extract parameters from a result report as generated by fit.spict.	

Description

Extract parameters from a result report as generated by fit.spict.

Usage

```
get.par(parname, rep = rep, exp = FALSE, random = FALSE, fixed = FALSE)
```

Arguments

parname	Character string containing the name of the variable of interest.
rep	A result report as generated by running fit.spict.
exp	Take exp of the variable? TRUE/FALSE.
random	DUMMY not used anymore. (Is the variable a random effect? TRUE/FALSE.)

fixed DUMMY not used anymore. (Is the variable a random effect? TRUE/FALSE)

Details

Helper function for extracting the value and uncertainty of a specific model parameter, random effect or derived quantity.

Value

A matrix with four columns containing respectively: 1) the lower 95

```
data(pol)
rep <- fit.spict(pol$albacore)
Bmsy <- get.par('logBmsy', rep, exp=TRUE)
Best <- get.par('logB', rep, exp=TRUE)
K <- get.par('logK', rep, exp=TRUE)</pre>
```

14 guess.m

get.spline

Get the values of the seasonal spline for F.

Description

Get the values of the seasonal spline for F.

Usage

```
get.spline(logphi, order, dtfine = 1/100)
```

Arguments

logphi Values of the phi vector. order Order of the spline.

dtfine Time between points where spline is evaluated.

Value

Spline values at the points between 0 and 1 with dtfine as time step.

guess.m

Use a simple linear regression to guess m (MSY).

Description

Use a simple linear regression to guess m (MSY).

Usage

```
guess.m(inp, all.return = FALSE)
```

Arguments

inp An input list containing data.

all.return If true also return a guess on Emsy (effort at MSY) and components of the linear

regression.

Details

Equations 9.1.7 and 9.1.8 on page 284 of FAO's tropical assessment book are used to guess MSY.

Value

The guess on MSY.

invlogit 15

invlogit

Inverse logit transform.

Description

Inverse logit transform.

Usage

```
invlogit(a)
```

Arguments

a

Value to take inverse logit of.

Value

Inverse logit.

invlogp1

Inverse log "plus one" transform

Description

Inverse log "plus one" transform

Usage

```
invlogp1(a)
```

Arguments

а

Value to take inverse logp1 of.

Details

If a = log(b-1), then the inverse transform is b = 1 + exp(a). Useful for values with lower bound at 1.

Value

Inverse logp1.

16 likprof.spict

latex.figure

Generate latex code for including a figure.

Description

Generate latex code for including a figure.

Usage

```
latex.figure(figfile, reportfile, caption = "")
```

Arguments

figfile Path to figure file.
reportfile Path to report file.

caption This character string will be included as the figure caption.

Value

Nothing.

likprof.spict

Create profile likelihood

Description

Create profile likelihood

Usage

```
likprof.spict(input)
```

Arguments

input

A list containing observations and initial values for non profiled parameters (essentially an inp list) with the additional key "likprof" (see details for required keys). A valid result from fit.spict() containing an "inp" key with the described properties is also accepted.

make.ellipse 17

Details

The "likprof" list must containg the following keys:

• "pars" A character vector of length equal 1 or 2 containing the name(s) of the parameters to calculate the profile likelihood for.

• "parrange" A vector containing the parameter range(s) to profile over: parrange = c(min(par1), max(par1), min(par2), max(par2)).

Optional:

"nogridpoints" Number of grid points to evaluate the profile likelihood for each parameter.
 Default: 9. Note: with two parameters the calculation time increases quadratically when increasing the number of gridpoints.

Value

The output is the input with the likelihood profile information added to the likelihood profile information ad

Examples

```
data(pol)
inp <- pol$albacore
inp$likprof <- list()
inp$likprof$pars <- 'logsdb'
inp$likprof$parrange <- c(log(0.05), log(0.4))
inp$likprof$nogridpoints <- 15
rep <- fit.spict(inp)
rep <- likprof.spict(rep)
plotspict.likprof(rep, logpar=TRUE)</pre>
```

make.ellipse

Calculate confidence ellipsis.

Description

Calculate confidence ellipsis.

Usage

```
make.ellipse(inds, rep)
```

Arguments

inds Indices of the two reported model parameters.rep A result report as generated by running fit.spict.

18 make.report

Details

Calculates the confidence ellipsis of two reported model parameters. This is particularly useful as a detailed view of the uncertainty of two correlated parameters.

Value

A matrix with two columns containing the x and y coordinates of the ellipsis.

make.report

Creates a pdf file containing the summary output and result plots

Description

Creates a pdf file containing the summary output and result plots

Usage

```
make.report(rep, reporttitle = "", reportfile = "report.tex",
   summaryoutfile = "summaryout.txt", keep.figurefiles = FALSE,
   keep.txtfiles = FALSE)
```

Arguments

rep A valid result from fit.spict with OSA residuals.

report title This character string will be printed as the first line of the report.

reportfile The generated tex code will be stored in this file.

summaryoutfile Output of the summary will be stored in this file as plain text.

keep.figurefiles

If TRUE generated figure files will not be cleaned up.

keep.txtfiles If TRUE generated txt files will not be cleaned up.

Details

This function probably requires that you are running linux and that you have latex functions installed (pdflatex).

Value

Nothing.

make.splinemat 19

make.splinemat	Make a spline design matrix	

Description

Make a spline design matrix

Usage

```
make.splinemat(nseasons, order, dtfine = 1/100)
```

Arguments

nseasons Number of seasons order Order of the spline

dtfine Time between points where spline is evaluated

Value

Spline design matrix.

plot.col	Plot model points colored depending on the quarter to which they belong.

Description

Plot model points colored depending on the quarter to which they belong.

Usage

```
## S3 method for class 'col'
plot(time, obs, obsx = NULL, pch = 1, add = FALSE,
   typ = "p", do.line = TRUE, add.legend = FALSE, ...)
```

Arguments

time	Time vector.
obs	Observation vector (or residual vector).
obsx	Second observation vector for use as independent variable instead of time.
pch	Point character.
add	If TRUE plot is added to the current plot.
typ	Plot type.
	Additional plotting arguments.

20 plot.spictcls

Value

Nothing.

plot.spictcls

3x3 plot illustrating spict results.

Description

3x3 plot illustrating spict results.

Usage

```
## S3 method for class 'spictcls'
plot(rep, logax = FALSE)
```

Arguments

rep A result report as generated by running fit.spict.

logax Take log of relevant axes? default: FALSE

Details

Create a 3x3 plot containing the following:

- 1. Biomass using plotspict.biomass().
- 2. One-step-ahead residuals, only if calculated, using plotspict.osar().
- 3. One-step-ahead auto-correlation function (only if calculated).
- 4. Estimated F versus estimated B using plotspict.fb().
- 5. Estimated fishing mortality using plotspict.f().
- 6. Observed versus predicted catches using plotspict.catch().
- 7. Observed versus theoretical production using plotspict.production().
- 8. Calculated time-constant using plotspict.tc().

Value

Nothing.

```
data(pol)
rep <- fit.spict(pol$albacore)
plot(rep)</pre>
```

plotspict.bbmsy 21

plotspict.bbmsy

Plot estimated B/Bmsy.

Description

Plot estimated B/Bmsy.

Usage

```
plotspict.bbmsy(rep, logax = FALSE, main = -1, plot.legend = TRUE,
   ylim = NULL, plot.obs = TRUE, qlegend = TRUE)
```

Arguments

rep A result report as generated by running fit.spict.

logax Take log of y-axis? default: FALSE

Details

Plots estimated B/Bmsy.

Value

Nothing.

Examples

```
data(pol)
rep <- fit.spict(pol$albacore)
plotspict.bbmsy(rep)</pre>
```

plotspict.biomass

Plot estimated biomass.

Description

Plot estimated biomass.

Usage

```
plotspict.biomass(rep, logax = FALSE, main = -1, plot.legend = TRUE,
  ylim = NULL, plot.obs = TRUE, qlegend = TRUE)
```

Arguments

rep A result report as generated by running fit.spict.

logax Take log of y-axis? default: FALSE

22 plotspict.catch

Details

Plots estimated biomass, Bmsy with confidence limits.

Value

Nothing.

Examples

```
data(pol)
rep <- fit.spict(pol$albacore)
plotspict.biomass(rep)</pre>
```

plotspict.btrend

Plot the expected biomass trend

Description

Plot the expected biomass trend

Usage

```
plotspict.btrend(rep)
```

Arguments

rep

A result report as generated by running fit.spict.

Value

Nothing.

plotspict.catch

Plot observed catch and predictions.

Description

Plot observed catch and predictions.

Usage

```
plotspict.catch(rep, main = -1, plot.legend = TRUE, ylim = NULL,
   qlegend = TRUE)
```

Arguments

rep

A result report as generated by running fit.spict.

plotspict.ci 23

Details

Plots observed catch and predictions using the current F and Fmsy. The plot also contains the equilibrium catch if the current F is maintained.

Value

Nothing.

Examples

```
data(pol)
rep <- fit.spict(pol$albacore)
plotspict.catch(rep)</pre>
```

plotspict.ci

Plot catch and index data.

Description

Plot catch and index data.

Usage

```
plotspict.ci(inp)
```

Arguments

inp

An input list containing data.

Value

Nothing

Description

Plot model diagnostic (data, residuals, and more)

Usage

```
plotspict.diagnostic(rep)
```

Arguments

rep

A result report as generated by running fit.spict.

24 plotspict.f

Value

Nothing.

Examples

```
data(pol)
rep <- fit.spict(pol$albacore)
rep <- calc.osa.resid(rep)
plotspict.diagnostic(rep)</pre>
```

plotspict.f

Plot estimated fishing mortality.

Description

Plot estimated fishing mortality.

Usage

```
plotspict.f(rep, logax = FALSE, main = -1, plot.legend = TRUE,
   ylim = NULL)
```

Arguments

rep A result report as generated by running fit.spict.

logax Take log of y-axis? default: FALSE

Details

Plots estimated fishing mortality with Fmsy and associated confidence interval.

Value

Nothing.

```
data(pol)
rep <- fit.spict(pol$albacore)
plotspict.f(rep)</pre>
```

plotspict.fb 25

plotspict.fb	Plot fishing mortality versus biomass.
--------------	--

Description

Plot fishing mortality versus biomass.

Usage

```
plotspict.fb(rep, logax = FALSE, plot.legend = TRUE, ext = TRUE,
  rel.axes = FALSE, xlim = NULL, ylim = NULL)
```

Arguments

rep A result report as generated by running fit.spict.

logax Take log of x and y-axes? default: FALSE

plot.legend Plot legend explaining triangle.

ext Add relative level axis to top and right side.

rel.axes Plot axes in relative levels instead of absolute.

Details

Plots estimated fishing mortality as a function of biomass together with reference points and the prediction for next year given a constant F. The equilibrium biomass for F fixed to the current value is also plotted.

Value

Nothing.

```
data(pol)
rep <- fit.spict(pol$albacore)
plotspict.fb(rep)</pre>
```

26 plotspict.infl

plotspict.ffmsy

Plot estimated relative fishing mortality.

Description

Plot estimated relative fishing mortality.

Usage

```
plotspict.ffmsy(rep, logax = FALSE, main = -1, plot.legend = TRUE,
   ylim = NULL)
```

Arguments

rep A result report as generated by running fit.spict.

logax Take log of y-axis? default: FALSE

Details

Plots estimated fishing mortality with Fmsy and associated confidence interval.

Value

Nothing.

Examples

```
data(pol)
rep <- fit.spict(pol$albacore)
plotspict.ffmsy(rep)</pre>
```

plotspict.infl

Plots influence statistics of observations.

Description

Plots influence statistics of observations.

Usage

```
plotspict.infl(rep)
```

Arguments

rep

A valid result from calc.influence().

plotspict.inflsum 27

Details

TBA

Value

Nothing.

plotspict.inflsum

Plots summary of influence statistics of observations.

Description

Plots summary of influence statistics of observations.

Usage

```
plotspict.inflsum(rep)
```

Arguments

rep

A valid result from calc.influence().

Details

TBA

Value

Nothing.

plotspict.likprof

Plots result of likelihood profiling.

Description

Plots result of likelihood profiling.

Usage

```
plotspict.likprof(input, logpar = FALSE)
```

Arguments

input Result of running likprof.spict().
logpar If TRUE log of parameters are shown.

28 plotspict.osar

Details

TBA

Value

Nothing but shows a plot.

plotspict.osar

Plot one-step-ahead residuals

Description

Plot one-step-ahead residuals

Usage

```
plotspict.osar(rep, collapse.I = TRUE, qlegend = TRUE)
```

Arguments

rep A result report as generated by running fit.spict.

collapse. I Collapse index residuals into one plot. Default: TRUE.

qlegend Plot legend for quarters.

Details

Plots observed versus predicted catches.

Value

Nothing.

```
data(pol)
rep <- fit.spict(pol$albacore)
rep <- calc.osa.resid(rep)
plotspict.osar(rep)</pre>
```

plotspict.priors 29

plotspict.priors

Plot priors and posterior distribution.

Description

Plot priors and posterior distribution.

Usage

```
plotspict.priors(rep, do.plot = 4)
```

Arguments

rep

A result from fit.spict.

do.plot

Integer defining maximum number of priors to plot.

Value

Nothing

plotspict.prodrate

Plot production rate as a function of biomass.

Description

Plot production rate as a function of biomass.

Usage

```
plotspict.prodrate(rep)
```

Arguments

rep

A result report as generated by running fit.spict.

Details

OBSOLETE!

Value

Nothing.

```
data(pol)
rep <- fit.spict(pol$albacore)
plotspict.prodrate(rep)</pre>
```

30 plotspict.retro

Description

Plot theoretical production curve and estimates.

Usage

```
plotspict.production(rep, n.plotyears = 40)
```

Arguments

rep A result report as generated by running fit.spict.

n. plotyears Plot years next to points if number of points is below n.plotyears. Default: 40.

Details

Plots the theoretical production curve (production as a function of biomass) as calculated from the estimated model parameters. Overlaid is the estimated production/biomass trajectory.

Value

Nothing.

Examples

```
data(pol)
rep <- fit.spict(pol$albacore)
plotspict.production(rep)</pre>
```

plotspict.retro

Plot results of retrospective analysis

Description

Plot results of retrospective analysis

Usage

```
plotspict.retro(rep)
```

Arguments

rep

A valid result from fit.spict.

plotspict.season 31

Value

Nothing

plotspict.season

Plot the mean F cycle

Description

Plot the mean F cycle

Usage

```
plotspict.season(rep)
```

Arguments

rep

A result report as generated by running fit.spict.

Details

If seasonal data are available the seasonal cycle in the fishing mortality can be estimated. This function plots this mean F cycle.

Value

Nothing.

plotspict.tc

Plot time constant.

Description

Plot time constant.

Usage

```
plotspict.tc(rep)
```

Arguments

rep

A result report as generated by running fit.spict.

Details

Plots the time required for the biomass to reach a certain proportion of Bmsy. The time required to reach 95% of Bmsy is highlighted.

32 pol

Value

Nothing.

Examples

```
data(pol)
rep <- fit.spict(pol$albacore)
plotspict.tc(rep)</pre>
```

pol

Fisheries data included in Polacheck et al. (1993).

Description

Fisheries data included in Polacheck et al. (1993).

Usage

```
data(pol)
```

Format

Data are lists containing data and initial values for estimation formatted to be used as an input to fit.spict().

Details

Fisheries data for south Atlantic albacore, northern Namibian hake, and New Zealand rock lobster.

Source

Polacheck et al. (1993), Canadian Journal of Fisheries and Aquatic Science, vol 50, pp. 2597-2607.

```
data(pol)
rep <- fit.spict(inp=pol$albacore)
rep <- fit.spict(inp=pol$hake)
rep <- fit.spict(inp=pol$lobster)</pre>
```

predict.b 33

	red	-1 -	- 4	1.
n	ra	าา	\sim T	n

Helper function for sim.spict().

Description

Helper function for sim.spict().

Usage

```
## S3 method for class 'b'
predict(B0, F0, gamma, m, K, n, dt, sdb)
```

Arguments

В0	Initial biomass.
F0	Fishing mortality.
gamma	gamma parameter in Fletcher's Pella-Tomlinson formulation.
m	m parameter in Fletcher's Pella-Tomlinson formulation.
K	Carrying capacity.
n	Pella-Tomlinson exponent.
dt	Time step.
sdb	Standard deviation of biomass process.

Value

Predicted biomass at the end of dt.

put.ax

Adds the x-axis to influence plots

Description

Adds the x-axis to influence plots

Usage

```
put.xax(rep)
```

Arguments

rep

A valid result from calc.influence().

read.aspic

Details

TBA

Value

Nothing.

read.aspic

Reads ASPIC input file.

Description

Reads ASPIC input file.

Usage

```
read.aspic(filename)
```

Arguments

filename

Path of the ASPIC input file.

Details

Reads an input file following the ASPIC 7 format described in the ASPIC manual (found here http://www.mhprager.com/aspic.html).

Value

A list of input variables that can be used as input to fit.spict().

```
## Not run:
filename <- 'YFT-SSE.a7inp' # or some other ASPIC 7 input file
inp <- read.aspic(filename)
rep <- fit.spict(inp)
summary(rep)
plot(rep)
## End(Not run)</pre>
```

read.aspic.res 35

read.aspic.res

Reads the parameter estimates of an Aspic result file.

Description

Reads the parameter estimates of an Aspic result file.

Usage

```
read.aspic.res(filename)
```

Arguments

filename

Name of the Aspic result file to read

Details

TBA

Value

Vector containing the parameter estimates.

refpointci

Draw CI around a reference point using polygon

Description

Draw CI around a reference point using polygon

Usage

```
refpointci(t, ll, ul, cicol = "ivory2")
```

Arguments

t Time vector.

11 Lower limit.

ul Upper limit.

cicol Colour of polygon

Value

Spline design matrix.

36 season.cols

retro

Conduct retrospective analysis

Description

Conduct retrospective analysis

Usage

```
retro(rep, nretroyear = 5)
```

Arguments

rep A valid result from fit.spict.

nretroyear Number of years of data to remove (this is also the total number of model runs).

Details

A retrospective analysis consists of estimating the model with later data points removed sequentially one year at a time.

Value

A rep list with the added key retro containing the results of the retrospective analysis. Use plot-spict.retro() to plot these results.

Examples

```
data(pol)
inp <- pol$albacore
rep <- fit.spict(inp)
rep <- retro(rep, nretroyear=6)
plotspict.retro(rep)</pre>
```

season.cols

Load season colors.

Description

Load season colors.

Usage

```
season.cols()
```

Value

Vector containing season colors.

sim.spict 37

sim.spict	Simulate data from Pella-Tomlinson model

Description

Simulate data from Pella-Tomlinson model

Usage

```
sim.spict(input, nobs = 100)
```

Arguments

input Either an inp list with an ini key (see ?check.inp) or a rep list where rep is the

output of running fit.spict().

nobs Optional specification of the number of simulated observations.

Details

Simulates data using either manually specified parameters values or parameters estimated by fit.spict().

Manual specification: To specify parameters manually use the inp\$ini format similar to when specifying initial values for running fit.spict(). Observations can be simulated at specific times using inp\$timeC and inp\$timeI. If these are not specified then the length of inp\$obsC or inp\$obsI is used to determine the number of observations of catches and indices respectively. If none of these are specified then nobs observations of catch and index will be simulated evenly distributed in time.

Estimated parameters: Simply take the output from a fit.spict() run and use as input to sim.spict().

Value

A list containing the simulated data.

```
data(pol)
# Simulate a specific number of observations
inp <- pol$albacore
inp$obsC <- NULL
inp$timeC <- NULL
inp$timeI <- NULL
inp$timeI <- NULL
set.seed(1)
sim <- sim.spict(inp, nobs=150)
repsim <- fit.spict(sim)
summary(repsim) # Note true values are listed in the summary
dev.new(width=10, height=10)
plot(repsim) # Note true states are shown with orange colour
# Simulate data with seasonal F</pre>
```

38 summary.spictcls

```
inp <- list()
inp$dteuler <- 1/4
inp$nseasons <- 2
inp$splineorder <- 1
inp$obsC <- 1:80
inp$obsI <- 1:80
inp$ini <- pol$albacore$ini
inp$ini$logphi <- log(2) # Seasonality introduced here
inp <- check.inp(inp)
sim2 <- sim.spict(inp)
par(mfrow=c(2, 1))
plot(sim2$obsC, typ='l')
plot(sim2$obsI[[1]], typ='l')</pre>
```

spict

Fits a continuous-time surplus production model to data

Description

Fits a continuous-time surplus production model to data

Author(s)

Martin W. Pedersen <map@aqua.dtu.dk>

References

```

See Also

```
test.spict
```

Examples

```
rep <- test.spict()</pre>
```

summary.spictcls

Output a summary of a fit.spict() run.

Description

Output a summary of a fit.spict() run.

Usage

```
summary.spictcls(object, numdigits = 8)
```

test.spict 39

Arguments

object A result report as generated by running fit.spict.

numdigits Present values with this number of digits after the dot.

Details

The output includes, the convergence message from the optimiser, the likelihood value of the parameters, the parameter estimates with 95

Value

Nothing.

Examples

```
data(pol)
rep <- fit.spict(pol$albacore)
summary(rep)</pre>
```

test.spict

Example of a spict analysis.

Description

Example of a spict analysis.

Usage

```
test.spict(dataset = "albacore")
```

Arguments

dataset

Specify one of the three test data sets: 'albacore', 'hake', 'lobster'. These can be accessed with the command data(pol).

Details

Loads a data set, fits the model, calculates one-step-ahead residuals, plots the results.

Value

A result report as given by fit.spict().

```
rep <- test.spict()</pre>
```

40 validate.spict

			-
+ 1	rue	\sim	~ 1
L	uc		σ_{\perp}

Load color of true values.

Description

Load color of true values.

Usage

```
true.col()
```

Value

Color vector

validate.spict

Simulate data and reestimate parameters

Description

Simulate data and reestimate parameters

Usage

```
validate.spict(inp, nsim = 50, nobsvec = c(15, 60, 240), estinp = NULL,
backup = NULL, df.out = FALSE)
```

Arguments

inp	An inp list with an ini key (see ?check.inp). If you want to use estimated parameters for the simulation create the inp\$ini from the pl key of a result of fit.spict().
nsim	Number of simulated data sets in each batch.
nobsvec	Vector containing the number of simulated observations of each data set in each batch.
estinp	The estimation uses the true parameters as starting guess. Other initial values to be used for estimation can be specified in estinp\$ini.
backup	Since this procedure can be slow a filename can be specified in backup where the most recent results will be available.

Details

Given input parameters simulate a number of data sets. Then estimate the parameters from the simulated data and compare with the true values. Specifically, the one-step-ahead residuals are checked for autocorrelation and the confidence intervals of the estimated Fmsy and Bmsy are checked for consistency.

WARNING: One should simulate at least 50 data sets and preferably more than 100 to obtain reliable results. This will take some time (potentially hours).

validation.data.frame 41

Value

A list containing the results of the validation with the following keys:

- "osarpvals" P-values of the Ljung-Box test for uncorrelated one-step-ahead residuals.
- "*msyci"Logical. TRUE if the true value of B/Fmsy was inside the 95% confidence interval for the estimate, otherwise FALSE
- "*msyciw" Width of the 95% confidence interval of the estimate of Bmsy/Fmsy.

Examples

```
data(pol)
rep0 <- fit.spict(pol$albacore)
inp <- list()
inp$ini <- rep0$pl
set.seed(1234)
validate.spict(inp, nsim=10, nobsvec=c(30, 60), backup='validate.RData')</pre>
```

validation.data.frame Collect results from the output of running validate.spict.

Description

Collect results from the output of running validate.spict.

Usage

```
validation.data.frame(ss)
```

Arguments

SS

Output from validation.spict.

Value

A data frame containing the formatted validation results.

42 write.aspic

write.aspic

Takes a SPiCT input list and writes it as an Aspic input file.

Description

Takes a SPiCT input list and writes it as an Aspic input file.

Usage

```
write.aspic(input, filename = "spictout.a7inp")
```

Arguments

input List of input variables or the output of a simulation using sim.spict().

filename Name of the file to write.

Details

TBA

Value

Noting.

```
data(pol)
sim <- (pol$albacore)
write.aspic(sim)</pre>
```
